

Tosan Case Study

Overview

Tosan is a leader in banking and payment solutions. The challenge was to transform a high-functionality, complex banking system into a user-centric experience that minimizes errors and maximizes efficiency.

Problem

Users faced significant challenges, including: * High cognitive load. * Unclear navigational flows. * Friction in repetitive tasks. * Low error tolerance.

Role

Product Designer: Responsible for user flow optimization, UI redesign, prototyping, and cross-functional collaboration with engineering teams.

Research

- Heuristic Evaluation: Assessing the existing system against usability principles.
- Stakeholder Interviews: Aligning business goals with user requirements.
- Audit of Screens: Mapping current workflows to identify bottlenecks.
- Information Architecture: Restructuring the system for intuitive navigation.

Design System

To ensure long-term scalability and consistency, a robust design system was implemented: * Component Library: A centralized repository of reusable elements. * Tokens: Defined values for color, typography, and spacing to ensure visual parity. * Interaction Patterns: Standardized behaviors for common UI elements. * Documentation: Clear guidelines for developer handoff. * Unified

Visual Language: Harmonizing disparate modules into a single, cohesive brand experience, resulting in increased consistency and reduced development time.

Solution

The redesign focused on making the complex simple through: * Progressive Disclosure: Showing information only when necessary to reduce cognitive load. * Clear Hierarchy: Prioritizing critical information and actions. * Simplified Forms: Streamlining data entry to reduce user frustration. * Action-Oriented Dashboards: Designing for user intent and immediate task execution. * Flow Optimization: Reducing multi-step processes into efficient, linear interactions.

Impact

- Faster Onboarding: New users reached proficiency in less time.
- Reduced Errors: Improved input validation and clearer feedback loops significantly lowered task failures.
- Efficiency: Higher task completion speed across core banking functions.
- Reliability: A more predictable and stable user interface.

Reflection

Fintech demands a foundation of absolute clarity and trust. Through this project, it became evident that a minimal, predictable system consistently outperforms complexity. The establishment of a scalable design system not only solved immediate usability issues but also created a framework that empowers future growth and development.
